Lab 1 - Part B

The following is your first chunk to start with. Remember, you can add chunks using the menu above (Insert -> R) or using the keyboard shortcut Ctrl+Alt+I. A good practice is to use different code chunks to answer different questions. You can delete this comment if you like.

Other useful keyboard shortcuts include Alt- for the assignment operator, and Ctrl+Shift+M for the pipe operator. You can delete these reminders if you don't want them in your report.

Load the Titanic dataset

```
dfTit <-
  read_csv("titanic.csv") %>%
  rename_all(tolower)
## Parsed with column specification:
## cols(
     PassengerId = col_double(),
     Survived = col_double(),
##
     Pclass = col_double(),
##
     Name = col_character(),
##
##
     Sex = col_character(),
    Age = col_double(),
##
##
    SibSp = col_double(),
    Parch = col_double(),
##
##
    Ticket = col_character(),
##
     Fare = col_double(),
     Cabin = col_character(),
##
##
     Embarked = col_character()
## )
```

What was in the titanic dataset?

Variable	Definition	Key
survived	Survival	0 = No, 1 = Yes
class	Ticket class	1 = 1st, 2 = 2nd, 3 = 3rd
name	Name	
sex	Gender	
age	Age in years	
sibsp	# of siblings / spouses aboard the Titanic	
parch	# of parents / children aboard the Titanic	
ticket	Ticket number	
fare	Passenger fare	
cabin	Cabin number	
embarked	Port of Embarkation C = Cherbourg, Q = Queenstown, S = Southampton	

Practice the Tidyverse functions

Part 1: Arrange

Q&A: Sort the Titanic dataset by age from high to low.

```
dfTit %>%
  arrange(desc(age))
## # A tibble: 891 x 12
      passengerid survived pclass name sex
                                                   age sibsp parch ticket fare

## # ... with 99 more rows, and 1 more variable: embarked <chr>
```

Q1: How many of the survived passengers are older than 35? [Hint: Yes, you can see the number of rows at the bottom, but you can also pipe into nrow() function]

```
dfTit %>%
filter(survived == 1, age >35) %>% nrow()
## [1] 83
```

Q2: Remember the twins from Part 1? Can you use the filter function to find their parent?

```
dfTit %>%
   filter( str_detect(name, "Baclini, Mrs."))

Part 7: Summarize

Q&A: Use the summarize command to find the mean age for all passengers.

```
dfTit %>%
    summarize(meanAge = mean(age, na.rm=TRUE)) # na.rm=TRUE is there to exclude
missing values; try removing it and see what happens!

## # A tibble: 1 x 1

## meanAge
## <dbl>
## 1 29.7
```

Q1: Determine the mean fare a passenger paid to get on board the Titanic.

```
dfTit %>%
    summarize(meanFare = mean(fare, na.rm=TRUE))

## # A tibble: 1 x 1

## meanFare

## <dbl>
## 1 32.2
```

Part 8: Summarize with groups

Q&A: Determine the mean fare of the passengers who survived. Compare it with the ones who did not survive.

Q1: What is the minimum and maximum age of the passengers based on whether they survived or not?

```
dfTit %>%
  group by(survived) %>%
  summarize( minAge = min(age, na.rm=TRUE), maxAge = max(age, na.rm=TRUE))
%>%
  ungroup()
## # A tibble: 2 x 3

```

Part 9: Combining verbs

Q&A: For the survived passengers who were on a first class ticket, find the mean age and fare by gender.

```
dfTit %>%
  filter(survived == 1 & pclass == 1) %>%
```

```
group by(sex) %>%
  summarize(avgAge = mean(age, na.rm=TRUE), avgFare = mean(fare, na.rm=TRUE))
%>%
  ungroup()
## # A tibble: 2 x 3
##
     sex
            avgAge avgFare
##
             <dbl>
     <chr>>
                     <dbl>
## 1 female
                     106.
              34.9
## 2 male
             36.2 74.6
```

Q1: After excluding individual passengers, calculate (i) the total cost per family (based on whether they are on the same ticket), (ii) the number of family members on the same ticket, and (iii) how many of these family members survived. Then, keep only the ticket number and the three variables you calculated, sort by the total cost descending, and remove the repetitions in the table [Hint: Use the distinct() function with ".keep_all = TRUE" option to display the details for each unique ticket].

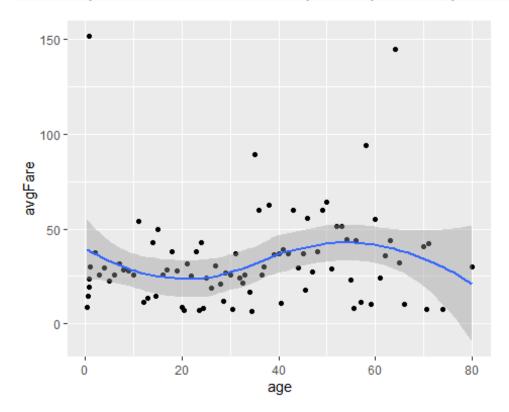

```
dfTit %>%
  filter(sibsp != 0 | parch != 0) %>%
  group by(ticket) %>%
  summarise( totalCost= sum(fare, na.rm=TRUE), familyMembers= n(), survived=
sum(survived, na.rm=TRUE)) %>%

Part 10: Visualizations

Q&A: Create a plot showing the relationship between age and median fare by age group, and fit a smoothed curve on it (no need to set any parameters, just use the defaults).

```
ageAvgFare <-
  dfTit %>%
  group_by(age) %>%
  summarize(avgFare = mean(fare)) %>%
  ungroup() %>%
  ggplot(aes(x=age,y=avgFare)) + geom_point() + geom_smooth()
```

```
ageAvgFare
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
## Warning: Removed 1 rows containing non-finite values (stat_smooth).
## Warning: Removed 1 rows containing missing values (geom_point).
```

Q1: Create a box-plot showing the distribution of fare across genders, and coloring it based on whether a passenger survived or not [Hint: Color will go into the aesthetics of the box plot].

```
distFare <-
  dfTit %>%
  ggplot(aes(x=sex,y=fare, color= factor(survived))) + geom_boxplot()

distFare
```
